Help for the Reading Teacher

New Directions in Research

William D. Page, editor

This collection presents recent research findings which offer new insights into the nature of the reading process. In one of the eight articles, Helen Robinson discusses research techniques which elicit information about the reading behavior of the learner, as well as those which focus on the materials read. Peggy Williams reports on a study exposing the misconceptions that can result from imprecise research; she finds that "evidence" linking "poor auditory discrimination" with poor reading among black children is in fact largely a reflection of the inappropriateness of the test for the group. Other articles deal with miscue patterns, the cloze procedure, and diagnostic procedures. The book has many practical suggestions for instructors, and also speaks to researchers, administrators, and reading professionals who provide support services to teachers. 120p. 1975.
